

Config Editor – Engineered Intelligence Demonstrator

Accessibility, Legacy Respect, and Human + EI Collaboration

A simple config GUI used as a living example of Engineered Intelligence in real time.

1. Overview

The Config Editor is a Tkinter-based application created as a working demonstration of Engineered Intelligence. It handles everyday configuration tasks while showcasing EI principles: clear GUI workflows, theme customization, accessibility-aware decisions, and iterative enhancements guided through human + Codex/GPT collaboration.

2. Key Features

- Load, edit, and save JSON configuration files in a single window.
- Key/value editor with type inference, history recall, and dropdown helpers.
- Multiple themes: High Contrast Dark, Standard Light, and the retro Green Screen CRT.
- Theme Color Picker with live preview, enabling custom palettes tuned in real time.
- Status indicators highlighting unsaved changes and clarity on save operations.
- EI Guide launch affordances: Help menu entry plus a prominent footer button.

3. Accessibility & Legacy – Green Screen CRT Theme

The Green Screen CRT theme honors the late 70s and 80s computing era, providing high-contrast visuals that are comfortable for low-vision users while signaling seasoned engineering practices. It was designed collaboratively with Codex/GPT, coming together in roughly thirty seconds and working immediately without debugging.

4. Engineered Intelligence (EI) Story

This project doubles as an EI sandbox: new features such as theme systems, guide launchers, and layout tweaks were shipped in rapid cycles. When an experiment broke the UI, the human + AI partners quickly diagnosed and restored it, preserving improvements. The human acts as the architect, setting intent and tone; EI executes precise changes, accelerating iteration and reinforcing a partnership that amplifies empathy, experience, and creativity.

5. EI Guide / Chatbot Vision

Instead of relying on static manuals, the Config Editor experiments with an EI Guide launcher. Selecting Help → Launch EI Guide (or the footer button) opens a conversational assistant, offering interactive documentation. This reflects a shift toward living guidance: users can ask questions, recruiters can explore context, and the system explains itself dynamically.

6. Tech Stack Summary

- Python + Tkinter for GUI, configuration handling, and accessibility features.
- Theme system with built-in palettes plus customizable Theme Color Picker.
- Accessibility considerations baked into color choices, contrast, and readable typography.
- ReportLab generates this PDF overview from a lightweight script.
- Codex / GPT collaboration accelerates design, debugging, and feature delivery.

Closing

This project demonstrates how legacy experience, accessibility, and modern intelligent systems can be woven into a practical, human-centered tool.
